

## Brief Technical Description & Screenshot samples

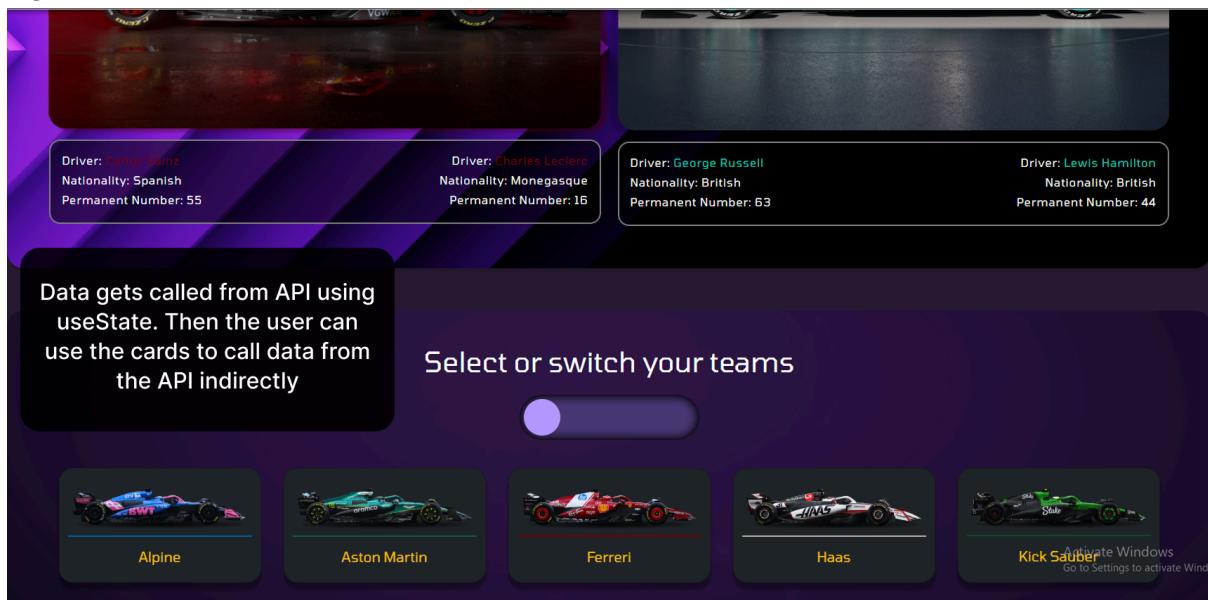

**Figure 1**

In AnalysisOne I'm using an F1 API called Jolpi: <https://api.jolpi.ca/ergast/f1/>.

This web-application is designed to make F1 content and statistics easier to look at and compare between teams. The current limitation is that the App can only go back a few years for some teams as most modern teams didn't exist before 2015. The visualization shown are bar charts, line charts, and a visual representation of team points as seen on the page in Figure 1

**Figure 2**

In **Figure 2** Users can select a team they want to compare with the provided cards. If the user wants to change which side of the comparison must happen, they interact with the switch and the cards will visually flip.

[Chart.js](#) is then used to visually represent the data and offer deeper insights into what the 2 teams might have to offer or in which ways they differ such as speed, points or time.
